

## Updated Firebase Setup (for Google + Email/Password)

Here is the simplified, click-by-click guide for setting up your project. This now includes enabling Google Sign-In.

### Step 1: Make Your Firebase Project

(This step is the same as before)

1. Go to the [Firebase Console](#) and sign in.
2. Click **"Add project"**.
3. Give it a name (like "My Pocket") and click **Continue**.
4. You can **un-check the "Enable Google Analytics" box** to make things simpler.
5. Click **"Create project"**.

### Step 2: Get Your App's "Secret Keys" (The Config)

(This step is the same as before. You've already done this, as you gave me the config!)

1. Once your project is ready, click **Continue**.
2. On the dashboard, click the **Web icon** ( `</>` ).
3. Give it a nickname ("My Pocket App").
4. **UN-check** "Also set up Firebase Hosting".
5. Click **"Register app"**.
6. Firebase shows you the `const firebaseConfig = { ... };` code. This is what you've already pasted into `login.html` and `index.html`.
7. Click **"Continue to console"**.

### Step 3: Turn On Login Methods (IMPORTANT UPDATE)

1. In your Firebase project, on the left-hand menu, click **Authentication** (under the "Build" section).
2. Click the **"Get started"** button.
3. In the "Sign-in method" tab, you need to enable **TWO** providers:

#### A) Enable Email/Password:

- Click on **"Email/Password"** from the list.
- Enable the **first toggle** (labeled "Email/Password").
- *(Optional: You can leave "Email link (passwordless sign-in)" enabled or disable it. Your new `login.html` doesn't use it, but it doesn't hurt.)*
- Click **"Save"**.

#### B) Enable Google (NEW STEP):

- Go back to the "Sign-in method" tab.
- Click on **"Google"** from the list.
- Click the **Enable** toggle.

- For the "Project-facing email address", just select your email from the dropdown list.
- Click **"Save"**.

#### Step 4: Add Your Website Address

(This step is the same as before and is CRITICAL)

1. Stay in the **Authentication** section.
2. Click the **"Settings"** tab (at the top of the page).
3. Scroll down to the **"Authorized domains"** section.
4. Click **"Add domain"**.
5. Type in your GitHub Pages domain (e.g., `atikle.github.io` ) and click **"Add"**.

#### Step 5: Create Your Cloud Database

(This step is the same as before)

1. On the left-hand menu, click **Firestore Database** (under the "Build" section).
2. Click the **"Create database"** button.
3. Select **"Start in production mode"**. Click **"Next"**.
4. Choose a location (the default is fine) and click **"Enable"**.

#### Step 6: Set Database Security Rules

(This step is the same as before)

1. After the database is made, click the **"Rules"** tab at the top.
2. **Delete all** the text in the editor.
3. **Copy and paste** this exact code into the box:

```
rules_version = '2';
service cloud.firestore {
  match /databases/{database}/documents {

    // This rule matches the exact path we use in the code
    match /artifacts/{appId}/users/{userId}/items/{itemId} {

      // This says: A user can read or write their *own* items,
      // but only if they are logged in.
      allow read, write: if request.auth != null && request.auth.uid == userId;
    }
  }
}
```

4. Click the **"Publish"** button.

#### You're All Set!

Now your setup is complete. You just need to follow the **Updated Setup Guide** and make sure you complete **Step 3B (Enable Google)**. Once you do that, your new `login.html` page will work perfectly.
